Introduction :

Covid-19 is a deadly disease caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) virus that causes a wide range of symptoms. The pandemic started in China in December 2019 and has since spread across the world. In the first three months, it reached almost every corner of the planet. Many countries were locked down to control this rapid spread, which had a huge impact on many parts of our daily lives. Bangladesh detected its first Covid-19 patients in the capital on March 8, prompting the government to go into a general lockdown on March 26. Since then, people have been staying at home except for emergencies, educational institutions, and most industrial establishments. And the economic zone remained closed, apart from education, business, and many other sectors that were badly affected by the Covid-19 pandemic. The disease began to spread from China in early 2020, and infections increased rapidly in March. As a result, many educational institutions, businesses, and offices around the world began to gradually close during this time and Bangladesh ceased all its operations on March 17 and became depopulated in all areas. There are both economic and humanitarian motivations to maintain continuity through computer technology. On the other hand, Bangladesh has no time to waste. A digital computer system is a type of system where activities in all organizations can be done using the internet. Due to the resurgence of the coronavirus pandemic, the entire world was facing widespread anxiety and uncertainty. Many governments around the world are keen to close this gap and reduce losses in all sectors as a result of the current situation. During the outbreak of COVID-19, the use of digital computer technology has undoubtedly been important in mitigating social, physical, and psychological risk factors as well as managing the meaning of social isolation and lockdown loneliness.

Objectives :

Within Bangladesh How computers have assisted us in advancing while our lives are at a stop, how they aided with the lockdown, and how the tasks have been performed during COVID-19. There has never been a global catastrophe like COVID-19. The Bangladeshi government is working to protect its citizens and help those who have been impacted. The people of Bangladesh are fighting bravely and utilizing cutting-edge technology to get through this new scenario despite the virus' quick spread. In addition to aiding in the battle against diseases, computer technology may also influence how we handle similar circumstances in the future.

Here are a few instances of how computer technology is being utilized to support us in Bangladesh as we defend against Covid-19.

- **Computer Business Continuity.**
- **Computer in freelancing, blogging, and YouTubing sector.**
- **Computer In Video Conferencing.**
- **Computer Use In Location Tracking.**
- **Computer Using In CCTV.**
- **Computer science in Medical.**
- **Computer In Stock Market.**
- **Computer In Online Delivery.**

Role of Computer :

1.Computer Business Continuity: Being unable to function in the same way as previously during this epidemic is a significant issue. In order to guarantee that workers continue to work from home and conduct business as usual, companies have swiftly developed work-from-home rules employing online meeting software and collaboration platforms.

2. Computer in freelancing, blogging, and YouTubing sector: In Bangladesh's freelance industry during the epidemic, computers are extremely crucial. People are already using freelancing to make money. Bangladesh is now ranked second in the world for freelance income. In Bangladesh, it is one of the main sources of foreign exchange revenues. However, computer use is also necessary for YouTubing and blogging. By placing Google AdSense advertisements on their blogs and YouTube channels, many people in Bangladesh are able to make money. These aid the nation in enhancing remittances.

3. Computer In Video Conferencing: Mandatory quarantines have interrupted daily life and decreased social interaction in Bangladesh throughout the outbreak. It encourages millions of individuals to connect and date online. Today, chatting and checking up with family and friends takes place digitally. Online lessons are offered by educators and health clubs. Even organizations are using digital meeting platforms to onboard new staff.

4.Computer Use In Location Tracking: The government probably uses this technology the most. During the epidemic in Bangladesh, it was crucial to follow people's whereabouts using the location data supplied by mobile phones in order to determine an infected person's movements prior to being isolated and the number of others who may have been close by the patient.

5.Computer Using In CCTV: In the event of a pandemic, safety precautions must be taken by employing CCTV and computer orders. For instance, after a family of three returned from Italy and tested positive for Covid-19, local officials in Kerala's Pathanamthitta district discovered that the family had traveled and interacted with a lot of people for a week prior to being quarantined. One way the local government found persons who could be sick was by looking at CCTV video from the area they frequented.

6.Computer science in Medical: Robots are being utilized in some nations during a pandemic to disinfect hospitals and other public spaces, transport medicine and other supplies to patients in hospitals, check patients' temperatures, and respond to frequently asked queries. AI, which can interpret hundreds of CT images in 20 seconds with a 96% accuracy rate, is even being used to identify the coronavirus. Technology techniques have emerged as crucial weapons in a worldwide pandemic for efficiently tracking and controlling disease outbreaks. Technology may not only act as a near substitute for medical staff when containment is a problem, but it can also match the scope and speed of the present epidemic's treatment requirements. The use of computers is crucial in the field of medicine. Diseases are diagnosed using the computer in a variety of ways, including X-ray, ECG, ECHO, CT scan, MRI scan, etc. A contemporary operating room without a computer is likewise unimaginable.

7. Computer In Stock Market: The stock market industry's deployment of computer technology during the epidemic has been beneficial for brokerage businesses. As more investors choose to participate in the stock market, some brokerage firms have experienced an increase in the number of clients. Clients have more time to access market conditions since they are largely remaining indoors as a result of the epidemic, which also raises trade volume.

8.Computer In Online Delivery: Due to increased customer demand during the epidemic, the online grocery business has experienced phenomenal development. Food is being delivered by robots via computers. Families, particularly those with little children and senior citizens, like to get their groceries online. As a result, there has been a notable rise in the number of new customers who utilize online apps to get their groceries delivered. Online delivery business models are drawing more and more clients because to features like the ability to select a desired delivery time slot and decreased delivery prices for purchases over a specific threshold.

Conclusion :

In conclusion, Covid-19 has demonstrated that computer technology advancement is assisting in the prompt, orderly, and composed management of the pandemic. The Covid-19 epidemic has taught us to be proactive in our preparation for any catastrophe, both individually and collectively. We must be ready to combat a pandemic like COVID-19. Computer technology is always improving, and it will surely continue to expand enormously. We are the ones who must fast adapt to advancements in computer technology and keep spending money to build new technological systems.
